

Package ‘PAMmisc’

January 10, 2022

Title Miscellaneous Functions for Passive Acoustic Analysis

Version 1.8.0

Description A collection of miscellaneous functions for passive acoustics.

Much of the content here is adapted to R from code written by other people.

If you have any ideas of functions to add, please contact Taiki Sakai.

addPgEvent	<i>Add Pamguard Event to Database</i>
------------	---------------------------------------

Description

Add a new event to an existing Pamguard database in the "OfflineEvents" table. If the specified eventType does not exist in the database, it will be added to the "Lookup" table.

Usage

```
addPgEvent(db, UIDs, binary, eventType, comment = NA, tableName = NULL)
```

Arguments

db	database file to add an event to
UIDs	vector of the UIDs of the individual detections to add to the event
binary	binary file containing the detections from UIDs
eventType	the name of the event type to add. If this is not already present in the database, it will be added to the "Lookup" table
comment	(optional) a comment for the event
tableName	(optional) specify the name of the Click Detector that generated the event table you want to add to. This only needs to be specified if you have more than one click detector, it defaults to the first "NAME_OfflineEvents" table in the database.

Value

Adds to the database db, invisibly returns TRUE if successful

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
myDb <- 'PamguardDatabase.sqlite3'
myBinaries <- c('./Binaries/Bin1.pgdf', './Binaries/Bin2.pgdf')
addUIDs <- c(10000001, 10000002, 20000007, 20000008)
addPgEvent(db = myDb, UIDs = addUIDs, binary = myBinaries, eventType = 'MyNewEvent')

## End(Not run)
```

addPgGps

Add GPS to a Pamguard Database

Description

Add GPS data to an existing Pamguard database

Usage

```
addPgGps(
  db,
  gps,
  source = c("SPOTcsv", "SPOTgpx", "csv"),
  format = c("%m/%d/%Y %H:%M:%S", "%m-%d-%Y %H:%M:%S",
             "%Y/%m/%d %H:%M:%S", "%Y-%m-%d %H:%M:%S"),
  tz = "UTC"
)
```

Arguments

db	database file to add gps data to
gps	data.frame of gps data or a character of the file name to be read. If a data.frame or non-SPOT csv file, needs columns UTC, Latitude, and Longitude. If multiple separate tracks are present in the same dataset, this should be marked with a column labeled Name
source	one of SPOTcsv, SPOTgpx, or csv. Describes the source of the GPS data, not needed if gps is a data.frame
format	date format for converting to POSIXct, only needed for source='csv'. See strptime
tz	timezone of gps source being added, will be converted to UTC

Value

Adds to the database db, invisibly returns the Name of the GPS track if successful (NA if not named)

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
# not run because example files don't exist
myDb <- 'PamguardDatabase.sqlite3'
# adding from a .gpx file downloaded from SPOT
spotGpx <- 'SpotGPX.gpx'
addPgGps(myDb, spotGpx, source='SPOTgpx')
# adding from a csv file with a Y-M-D H:M date format
gpsCsv <- 'GPS.csv'
addPgGps(myDb, gpsCsv, source='csv', format='%Y-%m-%d %H:%M')

## End(Not run)
```

browseEdinfo

Browse a List of Environmental Datasets

Description

This function browses the list of selected environmental datasets that are recommended as a starting point, and prompts the user to select one to use, returning an edinfo object. Also allows user to filter by variable name, matching will be attempted using regex

Usage

```
browseEdinfo(var = NULL)
```

Arguments

var the name or partial name of a variable to filter the available datasets by

Value

Returns an edinfo class object that can be used to get environmental data with other functions

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
# browse the full list (interactive)
edi <- browseEdinfo()

# search for sst datasets (interactive)
edi <- browseEdinfo(var='sst')

## End(Not run)
```

createSSP

Create Sound Speed Profiles

Description

Creates sound speed profiles (Depth vs Sound Speed) using temperature and salinity data downloaded from HYCOM data servers

Usage

```
createSSP(
  x,
  f = 30000,
  nc = NULL,
  ncVars = c("salinity", "water_temp"),
  dropNA = TRUE
)
```

Arguments

x	a data.frame with columns UTC, Longitude, and Latitude to create sound speed profiles for
f	the frequency (Hz) to generate the profile for
nc	netcdf file containing salinity and temperature data at depth, if NULL (default) these will be downloaded from HYCOM servers
ncVars	names of the salinity and temperature variables (in that order) in your netcdf file, only change these if you are providing your own file to nc
dropNA	logical flag to drop NA values from soundspeed profile from outputs. SSP will be calculated up to the maximum depth at each coordinate, which can vary. Setting this option to FALSE ensures that outputs are the same length for each coordinate, which can be useful

Value

a list with one element for each row of x, each element is a list containing speed, the sound speed (m/s), and depth (m)

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
# examples not run because they require internet connection
coords <- data.frame(UTC=as.POSIXct('2014-07-15 01:00:00', tz='UTC'),
                    Longitude = -119, Latitude = 33)
ssp <- createSSP(coords)
plot(x=ssp[[1]]$speed, y=-ssp[[1]]$depth, type='l')

## End(Not run)
```

dataToRanges

Create List of the Ranges of Coordinates

Description

Creates a named list with the ranges of Longitude, Latitude, and Time (UTC) data for use in functions like [formatURL](#). Can also specify an amount to buffer the min and max values by for each coordinate

Usage

```
dataToRanges(data, buffer = c(0, 0, 0))
```

Arguments

data	a data frame with longitude, latitude, and time (UTC) columns
buffer	a vector of the amount to buffer the min and max values of Longitude, Latitude, and UTC by (in that order)

Value

a list with the ranges of coordinates for Longitude, Latitude, and UTC. Ranges are listed as c(left, right), so if your data spans across the dateline

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
gps <- data.frame(Latitude = c(32, 32.1, 32.2, 32.2, 32.2),
                 Longitude = c(-110, -110.1, -110.2, -110.3, -110.4),
                 UTC = as.POSIXct(c('2000-01-01 00:00:00', '2000-01-01 00:00:10',
                                   '2000-01-01 00:00:20', '2000-01-01 00:00:30',
                                   '2000-01-01 00:00:40')))

dataToRanges(gps)

dataToRanges(gps, buffer = c(.05, .05, 86400))
```

decimateWavFiles

Decimate Wave Files

Description

Decimate a folder of .wav files or a single .wav file to a new sample rate.

Usage

```
decimateWavFiles(inDir, outDir, newSr, progress = TRUE)
```

Arguments

inDir	directory of wave files to decimate. Can also be a single .wav file.
outDir	directory to write wave files to
newSr	sample rate to decimate the files to
progress	logical flag to show progress bar

Details

This code is based on R code written by Jay Barlow.

Value

Invisibly returns the names of all files that were successfully decimated

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
origDir <- file.path(tempdir(), 'origSR')
decDir <- file.path(tempdir(), 'decSR')
writeClickWave('origWav.wav', outDir=origDir, signalLength = 1, clickLength = 100,
               clicksPerSecond = 200, frequency = 20000, sampleRate = 100000)
decWavs <- decimateWavFiles(origDir, decDir, 50000)
file.remove(paste0(origDir, 'origWav.wav'))
file.remove(decWavs)
```

downloadEnv

Download Environmental Data

Description

Downloads environmental data matching the coordinates in a set of data

Usage

```
downloadEnv(
  data,
  edinfo,
  fileName = NULL,
  buffer = c(0, 0, 0),
  progress = TRUE
)
```

Arguments

data	Data containing Longitude, Latitude, and UTC to download matching environmental data for
edinfo	either a edinfo object from getEdinfo or erddapToEdinfo or an ERDDAP dataset ID
fileName	name of the file to save downloaded data. If left as the default NULL, data will be saved to a temporary folder
buffer	numeric vector of the amount to buffer the Longitude, Latitude, and UTC coordinates by
progress	logical flag to show download progress

Value

if download is successful, invisibly returns the filename. If it fails returns FALSE.

If successful, the file name of downloaded data. If not, returns FALSE

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
data <- data.frame(Latitude = 32, Longitude = -117,
                  UTC = as.POSIXct('2000-01-01 00:00:00', tz='UTC'))
## Not run:
# not run because download could take time
# download jplMURSST41 dataset
edi <- erddapToEdinfo('jplMURSST41')
ncFile <- downloadEnv(data, edi, 'sstData.nc')

# browse suggested sst datasets, then download
edi <- browseEdinfo(var='sst')
ncFile <- downloadEnv(data, edi, 'sstData.nc')

## End(Not run)
```

edinfoToURL

Create a URL for Downloading Data from a edinfo Object

Description

Creates a properly formatted URL (see [formatURL](#)) from a datalist either from the package's recommended sources or an ERDDAP dataset id

Usage

```
edinfoToURL(edinfo, ranges)
```

Arguments

edinfo	a edinfo class object, either from getEdinfo or created by erddapToEdinfo
ranges	list of ranges for Longitude, Latitude, and UTC. Must be a named list with a vector of min/max values for each of the three dimensions

Value

a properly formatted URL that can be used to download environmental data

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
sstEdi <- getEinfo()[['jplMURSST41']]
# select all variables for download
sstEdi <- varSelect(sstEdi, TRUE)
edinfoToURL(sstEdi, ranges = list(Latitude = c(32, 33),
                                Longitude = c(-118, -117),
                                UTC = as.POSIXct(c('2000-01-01 00:00:00',
                                                  '2000-01-02 00:00:00'), tz='UTC')))
```

erddapList

A list of edinfo objects from ERDDAP data sources

Description

A list of edinfo objects, mostly used internally for functions. These objects represent different environmental data sources from ERDDAP servers and are used to download environmental data.

Usage

```
erddapList
```

Format

A list with objects of class edinfo

Source

Southwest Fisheries Science Center / NMFS / NOAA

erddapToEinfo

Create an edinfo Object from an ERDDAP Dataset Id

Description

Creates an edinfo object that can be used to create a URL for downloading environmental data using [edinfoToURL](#)

Usage

```
erddapToEinfo(
  dataset,
  baseUrl = "https://upwell.pfeg.noaa.gov/erddap/",
  chooseVars = TRUE
)

hycomToEinfo(
```

```
dataset = "GLBy0.08/expt_93.0",
baseurl = "https://ncss.hycom.org/thredds/ncss/",
chooseVars = TRUE
)
```

Arguments

dataset an ERDDAP or HYCOM dataset id, or the result from [info](#)
baseurl the base URL of an ERDDAP/HYCOM server
chooseVars logical flag whether or not to select which variables you want now

Value

an edinfo list object that can be used to download environmental data

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
# examples not run because they require internet connection
sstEdi <- erddapToEdinfo('jp1MURSST41')
# dataset from a diferent erddap server
sshEdi <- erddapToEdinfo('hawaii_soest_2ee3_0bfa_a8d6',
                        baseurl = 'http://apdrc.soest.hawaii.edu/erddap/')
# These work the same - erddap function will pass to hycom if appears to be hycom dataset
hycomEdi <- hycomToEdinfo('GLBy0.08/expt_93.0')
hycomEdi <- erddapToEdinfo('GLBy0.08/expt_93.0')

## End(Not run)
```

formatURL

Format URL for Environmental Data Download

Description

This creates a properly formatted URL for downloading environmental data either from an ERDDAP or HYCOM server. This URL can be pasted into a browser or submitted to something like `httr::GET` to actually download the data. Also see [edinfoToURL](#)

Usage

```
formatURL(
  base,
  dataset,
  fileType,
  vars,
  ranges,
  stride = 1,
  style = c("erddap", "hycom")
)
```

Arguments

base	the base URL to download from
dataset	the specific dataset ID to download
fileType	the type of file to download, usually a netcdf
vars	a vector of variables to download
ranges	a list of three vectors specifying the range of data to download, must a list with named vectors Longitude, Latitude, and UTC where each vector is c(min, max) (Note: even if the time is something like "dayOfYear" this should still be called 'UTC' for the purpose of this list). (see dataToRanges).
stride	the stride for all dimensions, a value of 1 gets every data point, 2 gets every other, etc.
style	either 'erddap' or 'hycom'

Value

a properly formatted URL that can be used to download environmental data

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
formatURL(
  base = "https://upwell.pfeg.noaa.gov/erddap/griddap/",
  dataset = "jplMURSST41",
  fileType = "nc",
  vars = "analysed_sst",
  ranges = list(
    Latitude = c(30, 31),
    Longitude = c(-118, -117),
    UTC = as.POSIXct(c('2005-01-01 00:00:00', '2005-01-02 00:00:00'), tz='UTC')
  ),
  stride=1,
  style = 'erddap'
```

)

`getEdinfo`*Browse a List of Curated Environmental Datasets*

Description

This function gets the list of environmental datasets provided as a recommended starting point for various measures

Usage

```
getEdinfo()
```

Value

a list of edinfo list objects

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
ediList <- getEdinfo()
ediList[[1]]
ediList[['jp1MURSST41']]
```

`hycomList`*A list of edinfo objects from HYCOM data sources*

Description

A list of edinfo objects, mostly used internally for functions. These objects represent different environmental data sources from HYCOM servers and are used to download environmental data.

Usage

```
hycomList
```

Format

A list with objects of class edinfo

Source

Southwest Fisheries Science Center / NMFS / NOAA

 matchEnvData

Match Data From an Existing Netcdf File or Download and Match

Description

Extracts all variables from a netcdf file matching Longitude, Latitude, and UTC coordinates in given dataframe

Usage

```
matchEnvData(
  data,
  nc = NULL,
  var = NULL,
  buffer = c(0, 0, 0),
  FUN = c(mean, median, sd),
  fileName = NULL,
  progress = TRUE,
  ...
)

## S4 method for signature 'data.frame'
matchEnvData(
  data,
  nc = NULL,
  var = NULL,
  buffer = c(0, 0, 0),
  FUN = c(mean, median, sd),
  fileName = NULL,
  progress = TRUE,
  ...
)
```

Arguments

data	dataframe containing Longitude, Latitude, and UTC to extract matching variables from the netcdf file
nc	name of a netcdf file, ERDDAP dataset id, or an edinfo object
var	(optional) vector of variable names
buffer	vector of Longitude, Latitude, and Time (seconds) to buffer around each data-point. All values within the buffer will be used to report the mean, median, and standard deviation
FUN	a vector or list of functions to apply to the data. Default is to apply mean, median, and standard deviation calculations

fileName (optional) file name to save downloaded nc file to. If not provided, then no nc files will be stored, instead small temporary files will be downloaded and then deleted. This can be much faster, but means that the data will need to be downloaded again in the future. If **fileName** is provided, then the function will attempt to download a single nc file covering the entire range of your data. If your data spans a large amount of time and space this can be problematic.

progress logical flag to show progress bar

... other parameters to pass to [ncToData](#)

Value

original dataframe with three attached columns for each variable in the netcdf file, one for each of mean, median, and standard deviation of all values within the buffer

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```

data <- data.frame(Latitude = 32, Longitude = -117,
                  UTC = as.POSIXct('2000-01-01 00:00:00', tz='UTC'))

## Not run:
# Not run because downloads files
sstEdi <- getEdinfo()[['jplMURSST41']]
sstEdi <- varSelect(sstEdi, TRUE)
# default calculates mean, median, and standard deviation
matchEnvData(data, sstEdi)
# get just mean within a buffer around coordinates
matchEnvData(data, sstEdi, FUN = mean, buffer = c(.01, .01, 86400))
# Can also work from an existing nc file
nc <- downloadEnv(data, sstEdi, buffer = c(.01, .01, 86400))
matchEnvData(data, nc = nc)
# Using a custom function
meanPlusOne <- function(x) {
  mean(x, na.rm=TRUE) + 1
}
matchEnvData(data, nc=nc, FUN=c(mean, meanPlusOne))

## End(Not run)

```

ncToData

Match Data From a Netcdf File

Description

Extracts all variables from a netcdf file matching Longitude, Latitude, and UTC coordinates in given dataframe

Usage

```
ncToData(
  data,
  nc,
  buffer = c(0, 0, 0),
  FUN = c(mean, median, sd),
  raw = FALSE,
  keepMatch = TRUE,
  progress = TRUE,
  verbose = TRUE
)
```

Arguments

data	dataframe containing Longitude, Latitude, and UTC to extract matching variables from the netcdf file
nc	name of a netcdf file
buffer	vector of Longitude, Latitude, and Time (seconds) to buffer around each data-point. All values within the buffer will be used to report the mean, median, and standard deviation
FUN	a vector or list of functions to apply to the data. Default is to apply mean, median, and standard deviation calculations
raw	logical flag to return only the raw values of the variables. If TRUE the output will be changed to a list with length equal to the number of data points. Each item in the list will have separate named entries for each variable that will have all values within the given buffer and all values for any Z coordinates present.
keepMatch	logical flag to keep the matched coordinates, these are useful to make sure the closest point is actually close to your XYZT
progress	logical flag to show progress bar for matching data
verbose	logical flag to show warning messages for possible coordinate mismatch

Value

original dataframe with three attached columns for each variable in the netcdf file, one for each of mean, median, and standard deviation of all values within the buffer

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
data <- data.frame(Latitude = 32, Longitude = -117,
                  UTC = as.POSIXct('2005-01-01 00:00:00', tz='UTC'))
nc <- system.file('extdata', 'sst.nc', package='PAMmisc')
# calculate mean median and stdev
```

```

ncToData(data, nc = nc)
# calculate only median
ncToData(data, nc=nc, FUN=median, buffer = c(.01, .01, 86400))
# custom function
meanPlusOne <- function(x) {
  mean(x, na.rm=TRUE) + 1
}
ncToData(data, nc=nc, FUN=c(mean, meanPlusOne))

```

peakTrough

Find Peaks and Troughs in a Spectrum

Description

Finds up to three peaks in a spectrum, as well as the troughs between those peaks.

Usage

```
peakTrough(spec, freqBounds = c(10, 30), dbMin = -15, smooth = 5, plot = FALSE)
```

Arguments

spec	the spectrum of a signal, the first column must be frequency in kilohertz, the second column must be dB
freqBounds	a two element vector specifying the frequency range around the highest peak to search for a second/third peak. Units are in kHz, a value of c(f1, f2) requires a second peak to be at least f1 kHz away from the first peak, but no further than f2 kHz away.
dbMin	minimum dB level for second / third peaks, relative to maximum dB. Any points lower than this dB level will not be considered a candidate peak.
smooth	the amount to smooth the spectrum before attempting to find second / third peaks. Uses a simple local average, smooth is the total number of points to use. A value of 1 applies no smoothing.
plot	logical flag to plot image of peak/trough locations on spectrum. Useful for finding appropriate settings for freqBounds and dbMin

Details

The first peak is the frequency with the highest dB level (first and last frequency points are ignored). Then this uses a very simple algorithm to find second and third peaks in a spectrum. Peak candidates are identified with a few simple steps:

Step 1 Use a local average of (smooth) points to smooth the spectrum.

Step 2 Check if a point is larger than both its neighbors.

Step 3 Check if points are within the frequency range specified by freqBounds. Points must be at least f1 kHz away from the frequency, but no further than f2 kHz away.

Step 4 Check if points are above the minimum dB level specified by dbMin.

From the remaining points the point with the highest dB level is selected as the second peak, then the frequency range filter of Step 3 is applied again around this second peak before attempting to find a third peak. If no second or third peak is found (ie. no values fall within the specified frequency and dB search ranges), then it will be set to 0. The trough values are set as the frequency with the lowest dB level between any peaks that were found. The trough values will be 0 for any peaks that were not found.

If you are unsure of what levels to specify for freqBounds and dbMin, setting plot=TRUE will show a visualization of the search range and selected peaks so you can easily see if the selected parameters are capturing the behavior you want.

Value

a dataframe with the frequencies (in kHz) of up to 3 peaks and 2 troughs between those peaks. Also reports the peak-to-peak distance. Any peaks / troughs that were not able to be found (based on freqBounds and dbMin parameters) will be 0.

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
clickWave <- createClickWave(signalLength = .1, clickLength = 1000, clicksPerSecond = 200,
                             frequency = 3e3, sampleRate = 10e3)
peakTrough(seewave::spec(clickWave, plot=FALSE), plot=TRUE)
```

raytrace

Raytrace Through a Soundspeed Profile

Description

Traces the ray of a sound through a varying soundspeed profile for a fixed amount of time. Also plots the provided sound speed profile and all traces generated. All code here is based on MATLAB code originally written by Val Schmidt from the University of New Hampshire Val Schmidt (2021). raytrace <https://www.mathworks.com/matlabcentral/fileexchange/26253-raytrace>, MATLAB Central File Exchange. Retrieved June 29, 2021.

Usage

```
raytrace(x0, z0, theta0, tt, zz, cc, plot = TRUE, progress = FALSE)
```

Arguments

<code>x0</code>	starting horizontal coordinate in meters
<code>z0</code>	starting vertical coordinate in meters
<code>theta0</code>	starting angle(s) of ray in degrees
<code>tt</code>	max travel time of ray in seconds
<code>zz</code>	vertical coordinates of sound speed profile (positive values are down)
<code>cc</code>	sound speed measurements at <code>zz</code> locations, meters / second
<code>plot</code>	logical flag to plot. Can be a vector of length two to individually select plotting one of the two plots generated
<code>progress</code>	logical flag to show progress bar

Value

A list with four elements: `x`, the horizontal coordinates of ray path, `z` the vertical coordinates of ray path, `t` actual travel time of ray in seconds, and `d` the total distance the ray traveled. Each individual item in the output is a list with one entry for each `theta0` provided.

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
# Setup the sound speed profile
zz <- seq(from=0, to=5000, by=1)
cc <- 1520 + zz * -.05
cc[751:length(cc)] <- cc[750] + (zz[751:length(zz)] - zz[750])*0.014
rt <- raytrace(0, 0, 5, 120, zz, cc, TRUE)
```

readGPXTrack

Read Tracks from a GPX File

Description

Read in a GPX file and convert the tracks to a dataframe

Usage

```
readGPXTrack(x)
```

Arguments

<code>x</code>	a path to a .gpx file
----------------	-----------------------

Value

a dataframe with columns Latitude, Longitude, UTC, and Name

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
gpxFile <- system.file('extdata', 'GPX.gpx', package='PAMmisc')
gpxData <- readGPXTrack(gpxFile)
str(gpxData)
```

squishList

Compress a List by Name

Description

Attempts to compress a list by combining elements with the same name, searching recursively if there are lists in your list

Usage

```
squishList(myList)
```

Arguments

`myList` a list with named elements to be compressed

Details

items with the same name are assumed to have the same structure and will be combined. Dataframes will be combined with `bind_rows`, vectors just be collapsed into one vector, matrices will be combined with `rbind`, lists will be combined recursively with another call to `squishList`

Value

a list with one element for every unique name in the original list

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
myList <- list(a=1:3, b=letters[1:4], a=5:6, b=letters[4:10])
squishList(myList)
```

```
myList <- list(a=1:3, b=data.frame(x=1:3, y=4:6), b=data.frame(x=10:14, y=1:5))
squishList(myList)
```

```
myList <- list(a=list(c=1:2, d=2), b=letters[1:3], a=list(c=4:5, d=6:9))
squishList(myList)
```

straightPath

Mark Straight Path Segments in GPS Track

Description

This function attempts to mark portions of a GPS track where a ship is traveling in a straight line by comparing the recent average heading with a longer term average heading. If these are different, then the ship should be turning. Note this currently does not take in to account time, only number of points

Usage

```
straightPath(gps, nSmall = 10, nLarge = 60, thresh = 10, plot = FALSE)
```

Arguments

gps	gps data with columns Longitude, Latitude, and UTC (POSIX format). Usually this has been read in from a Panguard database, in which case columns Heading and Speed will also be used.
nSmall	number of points to average to get ship's current heading
nLarge	number of points to average to get ship's longer trend heading
thresh	the amount which nSmall and nBig should differ by to call this a turn
plot	logical flag to plot result, gps must also have columns Latitude and Longitude

Value

the original dataframe gps with an added logical column `straight` indicating which portions are approximately straight

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
gps <- data.frame(Latitude = c(32, 32.1, 32.2, 32.2, 32.2),
  Longitude = c(-110, -110.1, -110.2, -110.3, -110.4),
  UTC = as.POSIXct(c('2000-01-01 00:00:00', '2000-01-01 00:00:10',
    '2000-01-01 00:00:20', '2000-01-01 00:00:30',
    '2000-01-01 00:00:40')),
  Heading = c(320, 320, 270, 270, 270),
  Speed = c(.8, .8, .5, .5, .5))

straightPath(gps, nSmall=1, nLarge=2)

straightPath(gps, nSmall=1, nLarge=4)
```

 updateUID

Update Detection UIDs

Description

Update the UIDs of detections in a Pamguard database. UIDs can become mismatched when re-running data, this will attempt to re-associate the new UIDs in binary files with detections in the database

Usage

```
updateUID(db, binaries, verbose = TRUE, progress = TRUE)
```

Arguments

db	database file to update UIDs
binaries	folder of binary files to use for updating
verbose	logical flag to show summary messages
progress	logical flag to show progress bars

Value

Same database as db, but with an additional column "newUID" added to each detection table with updated UIDs if found. "newUID" will be -1 for any detections where no match was found

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
## Not run:
# not run because sample data does not exist
db <- 'MismatchedUid.sqlite3'
bin <- './BinaryFolder'
updateUID(db, bin)

## End(Not run)
```

varSelect

Utility for Selecting Variables to Download

Description

Loops through the available variables in an edinfo object and asks whether or not each should be downloaded, then stores the result for passing on to [formatURL](#)

Usage

```
varSelect(edinfo, select = NULL)
```

Arguments

edinfo	a datalist, either from getEdinfo or created by erddapToEdinfo
select	(optional) logical vector of which variables to select. If left as default NULL, user will be prompted to select which variables to keep. If not NULL, can either be a single TRUE to select all variables, or a logical vector of length equal to the number of variables in edinfo

Value

the same object as edinfo with an updated varSelect field

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
sstEdi <- getEdinfo()[['jp1MURSST41']]
## Not run:
# interactively select
sstEdi <- varSelect(sstEdi)

## End(Not run)
```

```
# select all variables
sstEdi <- varSelect(sstEdi, TRUE)
# select the first two of four
sstEdi <- varSelect(sstEdi, c(TRUE, TRUE, FALSE, FALSE))
```

wignerTransform

Calculate the Wigner-Ville Transform of a Signal

Description

Calculates the Wigner-Ville transform a signal. By default, the signal will be zero-padded to the next power of two before computing the transform, and creates an NxN matrix where N is the zero-padded length. Note that this matrix can get very large for larger N, consider shortening longer signals.

Usage

```
wignerTransform(signal, n = NULL, sr, plot = FALSE)
```

Arguments

signal	input signal waveform
n	number of frequency bins of the output, if NULL will be the next power of two from the length of the input signal (recommended)
sr	the sample rate of the data
plot	logical flag whether or not to plot the result

Details

This code mostly follows Pamguard's Java code for computing the Wigner-Ville and Hilbert transforms.

Value

a list with three items. `tfr`, the real values of the wigner transform as a matrix with `n` rows and number of columns equal to the next power of two from the length of the input signal. `f` and `t` the values of the frequency and time axes.

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
clickWave <- createClickWave(signalLength = .05, clickLength = 1000, clicksPerSecond = 200,
                             frequency = 3e3, sampleRate = 10e3)
wt <- wignerTransform(clickWave@left, n = 1000, sr = 10e3, plot=TRUE)
```

`writeAMWave`*Write Amplitude Modulated Waveform*

Description

Write a wave file for a synthesized amplitude modulated call

Usage

```
writeAMWave(  
    fileName,  
    outDir,  
    signalLength,  
    modFrequency,  
    frequency,  
    sampleRate,  
    window = c(0.55, 0.45),  
    silence = c(0, 0),  
    gainFactor = 0.1  
)
```

```
createAMWave(  
    signalLength,  
    modFrequency,  
    frequency,  
    sampleRate,  
    window = c(0.55, 0.45),  
    silence = c(0, 0),  
    gainFactor = 0.1  
)
```

Arguments

<code>fileName</code>	name of the file to write. If missing, the file be named usign <code>signalLength</code> , <code>modFrequency</code> , <code>frequency</code> , and <code>sampleRate</code>
<code>outDir</code>	directory to write wave files to
<code>signalLength</code>	length of signal to create in seconds
<code>modFrequency</code>	modulation frequency in Hz of the amplitude modulation
<code>frequency</code>	frequency of the AM call
<code>sampleRate</code>	sample rate for the wave file to create
<code>window</code>	window constants for applying the amplitude modulation. See details.
<code>silence</code>	silence to pad before and after signal in seconds
<code>gainFactor</code>	scaling factor between 0 and 1. Low numbers are recommended (default 0.1)

Details

Amplitude modulated signals are modelled as an ideal sinusoid multiplied by a window function. The window function is an offset sinusoid with frequency equal to the modulation frequency:

$$W = .5 + .45 * \sin(2\pi mft)$$

See `example(writeAMWave)` for a plot showing how this works.

Value

`writeAMWave` invisibly returns the file name, `createAMWave` returns a [Wave](#) class object

Author(s)

Taiki Sakai <taiki.sakai@noaa.gov>

Examples

```
# Visualisation of modelled AM wave
signal <- sin(2*pi*100*(1:1000)/1000)
window <- .55 + .45 * sin(2*pi*15*(1:1000)/1000)
oldMf <- par()$mfrow
par(mfrow=c(3,1))
plot(signal, type='l')
plot(window, type='l')
plot(window*signal, type='l')
tmpFile <- file.path(tempdir(), 'tempWav.wav')
writeAMWave(tmpFile, signalLength = 1, modFrequency = 1000,
             frequency = 30000, sampleRate = 100000)
file.remove(tmpFile)
amWave <- createAMWave(signalLength = 1, modFrequency = 1000,
                       frequency = 30e3, sampleRate = 100e3)
par(mfrow=oldMf)
```

writeClickWave

Write Click Waveform

Description

Write a wave file for a synthesized delphinid click

Usage

```
writeClickWave(
  fileName,
  outDir,
  signalLength,
  clickLength,
```

```
        clicksPerSecond,  
        frequency,  
        sampleRate,  
        silence = c(0, 0),  
        gainFactor = 0.1  
    )  
  
createClickWave(  
    signalLength,  
    clickLength,  
    clicksPerSecond,  
    frequency,  
    sampleRate,  
    silence = c(0, 0),  
    gainFactor = 0.1  
)
```

Arguments

fileName	name of the file to write. If missing, the file be named usign signalLength, clickLength, clicksPerSecond, frequency, and sampleRate
outDir	directory to write wave files to
signalLength	length of signal to create in seconds
clickLength	length of each click in microseconds
clicksPerSecond	number of clicks per second
frequency	frequency of the clicks
sampleRate	sample rate for the wave file to create
silence	silence to pad before and after signal in seconds
gainFactor	scaling factor between 0 and 1. Low numbers are recommended (default 0.1)

Details

This code is based on Matlab code by Julie Oswald (2004). Clicks are simulated as an exponentially damped sinusoid.

Value

writeClickWave invisibly returns the file name, createClickWave returns a [Wave](#) class object
